

Identity theory and nomological danglers

Day 4 – Nature of Mind

Identity theory

- Identity theory holds that mental states and mental processes are identical to brain states and brain processes

Identity theory

- Identity theory holds that mental states and mental processes are identical to states and processes of the brain and nervous system
- This does NOT mean that, e.g., my toothache is caused by processes in my nervous system and in my brain.

Identity theory

- Identity theory holds that mental states and mental processes are identical to states and processes of the brain and nervous system
- This does NOT mean that, e.g., my toothache is *caused* by processes in my nervous system and in my brain.
 - **It means that my toothache IS such a process**

Identity theory

- Identity theory holds that mental states and mental processes are identical to states and processes of the brain and nervous system
- This does NOT mean that, e.g., my toothache is *caused* by processes in my nervous system and in my brain.
 - **It means that my toothache IS such a process**
 - **Nothing can cause itself**

Identity theory

- Some materialist philosophers (like J. J. C. Smart) reject logical behaviorism because of the *qualia* (sensations or perceptions)

Identity theory

- Some materialist philosophers (like J. J. C. Smart) reject logical behaviorism because of the *qualia*
- They are not convinced that, when you have a certain sensation (like a toothache), you are just disposed to say or do certain things

Identity theory

- Some materialist philosophers (like J. J. C. Smart) reject logical behaviorism because of the *qualia*
- They are not convinced that, when you have a certain sensation (like a toothache), you are just disposed to say or do certain things
 - Holding your jaw

Identity theory

- Some materialist philosophers (like J. J. C. Smart) reject logical behaviorism because of the *qualia*
- They are **not** convinced that, when you have a certain sensation (like a toothache), you are just disposed to say or do certain things
 - Holding your jaw
 - Asking someone to call the dentist and make an appointment for you

Identity theory

- They are believe there is something more to experiencing **qualia** than being disposed to behave in certain ways.

Identity theory

- They are believe there is something more to experiencing **qualia** than being disposed to behave in certain ways.
 - A sensation or perception is a process in the brain and nervous system

Identity theory

- They are believe there is something more to experiencing **qualia** than being disposed to behave in certain ways.
 - A sensation or perception is a process in the brain and nervous system
 - When you say you have a toothache, at least part of what you are doing is reporting that process.

Identity theory

- They are believe there is something more to experiencing **qualia** than being disposed to behave in certain ways.
 - A sensation or perception is a process in the brain and nervous system
 - When you say you have a toothache, at least part of what you are doing is reporting that process.
 - **You are not reporting an experience you are having in some non-physical mind**

Identity theory

- Materialists like Smart cannot accept that everything in the world can be explained in purely physical terms except the mind.

Identity theory

- Materialists like Smart cannot accept that everything in the world can be explained in purely physical terms except the mind.
- If that were the case, mental states such as sensations would be odd “nomological danglers”

Identity theory

- If that were the case, mental states such as sensations would be odd “nomological danglers”
 - They would sit outside of the scope of the physical laws that explain every other aspect of our world.

Identity theory

- If that were the case, mental states such as sensations would be odd “nomological danglers”
 - They would sit outside of the scope of the physical laws that explain every other aspect of our world.
 - The ultimate physical laws of the universe, they claim, will be able to explain sensations in physical terms.
